## **Abstract**

Styles of Parental Socialization and their Relation to Shyness among the first Secondary Students in the Ramallah and al Bireh Governorate.

Prepared by: Nadir T.S. Shawamreh

Supervised by: Nabil .Abedelhadi

The present study aimed at discovering the relationship between the parental socialization styles (democratic, authoritarian), (Over- protection, negligence) and the level of shyness as viewed by the students themselves (students by the 2<sup>nd</sup> secondary grade in Ramallah & al Bireh governorate). The study also aimed to discover the significant differences the level of shyness at ( $\alpha \leq 0.05$ ) due to the study variables (sex, major, father's level of education, mother's level of education, economic level of the family, place of residence and type of school). The study tried to answer the following study questions.

1. What are the methods of socialization style to the students of first secondary class in Ramallah & al- Bireh districts?
2. Do the parent's socialization styles change due to: (sex, major, father's education level, mother's education level, economical status, place of residence and type of school).
3. What is the shyness level of the students of first secondary class at Ramallah & al- Bireh schools?
4. Does the shyness level change due to: (sex, major, father's level of education, mother's level of education, economical status, place of residence and type of school)?
5. Is there any relationship between type of socialization styles and shyness level?

This study was applied on a cluster random sample of (484) students from Ramallah & Al- Bireh governmental and private schools (Scientific, literary) streams in the 2<sup>nd</sup> semester of (2006, 2007).

The researcher has used two scales first: methods of parent's socialization style by (Saqar ,1984), the internal consistency of this scale according to Cronbach Alpha was (0.71). Secondly, shyness rate for (Dorraini, B.T), the internal consistency (0.86) according to Cronbach Alpha.

The hypotheses of the study were tested at the significance level ( $\alpha \leq 0.05$ ) using the SPSS.

Results of the study were:

1. Parent's socialization style as viewed by the first secondary students in Ramallah & al- Bireh is closer to the democratic method and to neglect.
2. There are statistical differences at the level ( $\alpha \leq 0.05$ ) in the methods of parent's socialization style as seen by the students due to sex in favor of female students.
3. There are statistical differences at ( $\alpha \leq 0.05$ ) in patterns of parent's socialization style as seen by students due to specialization, in favor of the scientific stream.
4. There are statistical significant differences at ( $\alpha \leq 0.05$ ) in the types of parental socialization, due to the educational level of the father, and the education level of the mother and the favor of those fathers who hold a master degree or above. They emphasized the spread of the democratic style of the father and the neglect style of the mother.
5. There are statistical differences at ( $\alpha \leq 0.05$ ) in the socialization styles as viewed by students due monthly income, in favor of those who have a middle income and high income; those students assured that they have been treated democratically by their parents.
6. There are statistical differences at ( $\alpha \leq 0.05$ ) due to a place of residence in favor the democratic style.
7. There are statistical differences at ( $\alpha \leq 0.05$ ) in patterns of socialization style due to type of school in favor of private schools. They assured a higher degree of democratic socialization style of parents.
8. The level of the first secondary class students at Ramallah & Al- Bireh schools is moderate ( $X = 0.71$ ).

9. There are statistical differences at ( $\alpha \leq 0.05$ ) in the level of shyness among the students due to sex and in favor of female students.
10. There were statistical differences at ( $\alpha \leq 0.05$ ) in the level of shyness due to stream in favor of those in the literary stream.
11. There are statistical differences of shyness at rate ( $\alpha \leq 0.05$ ) for those students whom their parents have low certificates, they had highly range of shyness.
12. There are statistical differences at the level of ( $\alpha \leq 0.05$ ) of shyness for those students who have low monthly income.
13. There were statistical differences at the level of ( $\alpha \leq 0.05$ ) in level of shyness of students related to place of residence for benefit of camps population, they had the highest level of shyness.
14. There were significant statistical differences at the level of ( $\alpha \leq 0.05$ ) in the level of shyness among students due to type of school and in favor of governmental schools.
15. There was an inverse relationship at ( $\alpha \leq 0.05$ ) between the level of shyness and the following upbringing styles: the democratic authoritative for the parent's overprotective neglect for the mothers and level of shyness so as when the socialization type (democratic and overprotection increases the level of shyness decreases).

Also, there was a significant direct relationship between overprotection neglect of the father and the level of shyness, so that when this type of socialization increases the level of shyness also increases and vice versa.
